

I/O1 and I/O2: If used as outputs, the sockets can be used for audio signals or control voltages. "O/I" is internally connected to either "I/O1" or "I/O2" via voltage control at the "CV" input. The currently active socket is indicated with an LED.

O/I: If used as an output, the socket can be used both for audio signals and for control voltages. Either "I/O1" or "I/O2" is internally connected to "O/I" via the control voltage at the "CV" input.

Assignment and function of the sockets in the lower sub-module are identical.
