

Wait: Button to stop a connected sequencer like the A-155 exactly at the end of the current 4/4 bar. For this purpose, a trigger is output at the "Stp" output and the gate signal at the "Sta" output is ended (if the start signal is configured as a gate via jumper JP9B). Pressing the button again starts the connected analog sequencer exactly at the beginning of the next 4/4 bar that follows this pressing of the button. Then a gate or trigger signal is again output at the "Sta" output. A reset does not take place because the start and stop occur exactly at the clock change.
